RE: CC DOCKET 96-45, IN THE MATTER OF FEDERAL-STATE JOINT BOARD ON UNIVERSAL SERVICE

Dear Ms. Roman Salas:

On November 3, 1998, Tom McCabe of TDS TELECOM met with Mark Long of the Florida PUC and also of the Universal Service Joint Board to discuss TDS TELECOM's positions on Universal Service Issues referred to the Federal-State Joint Board.

Enclosed herewith are the documents discussed with Mr. Long during this meeting. I have enclosed copies in accordance with Commission rules. Please date stamp and return the provided copy in the enclosed self-addressed, stamped envelope.

Respectfully submitted,

Elizábeth H. Valinoti

TDS TELECOM Positions on Universal Service Issues Referred to the Federal-State Joint Board October 1998

TO

Proxy model decisions made for non-rural companies are likely to carry through to rural companies.

- While the Joint Board is currently reviewing high-cost support issues for non-rural ILECs, regulatory history suggests that rules adopted for non-rural ILECs will eventually at least in part apply to rural ILECs. (For example: federal access charge reform)
- Effective analysis of the models by rural companies is extremely difficult because of the complexity of the
 models, and because much of the data and processes used remain proprietary or at least inaccessible. (For
 example: geocoding data; mapping of customer location; need to understand Visual Basic or other
 programming languages)
- Customer location algorithms remain unreliable and generate widely variable average loop lengths that
 differ significantly from actual measures. Such variation contributes to cost estimates that deviate greatly
 from actual costs. (See slides 3 and 4)
- TDS TELECOM analysis of the currently available Hatfield and BCPM models at the 25% federal support level indicates extreme variability in resulting high-cost support. This company-by-company variability would generate unpredictable – and often insufficient – support, thereby jeopardizing the universal service principles of the 1996 Act. (See slide 6)

Determining universal service support through the use of actual costs remains the most viable alternative for rural ILECs.

- The 1996 Act goals of reasonable and comparable rates in rural areas will be jeopardized without specific, predictable and sufficient support amounts generated through use of actual costs. To date, the use of actual costs appears to be the best measure for support needs. (See slide 1A)
- Predictable support, as that afforded by current mechanisms, will enable the continued investment in rural infrastructure necessary for rural economic development.

Disaggregating universal service support into geographic areas smaller than study areas is necessary to preserve universal service while promoting competition in rural areas.

- Averaging support across a study area results in loss of high-cost support when low-cost customers are lost to competitors.
- Disaggregation of support will help prevent the detrimental effects of "creamskimming," including loss of necessary support for the rural ILEC's remaining customers.
- Disaggregation of support will also prevent a windfall of unnecessary support to a competing ETC serving the lower cost customers.
- Proxy models may provide an acceptable method of accomplishing disaggregation. In fact, proxy models were originally designed for this purpose, not to determine the size of a universal service fund.

The FCC's proposed 25%-75% jurisdictional split of federal and state high-cost support will not provide adequate universal service support, particularly in high-cost states.

 25% of high-cost support determined by a proxy model is typically less than what rural LECs receive today from federal universal service programs. (See slides 1 and 1A)

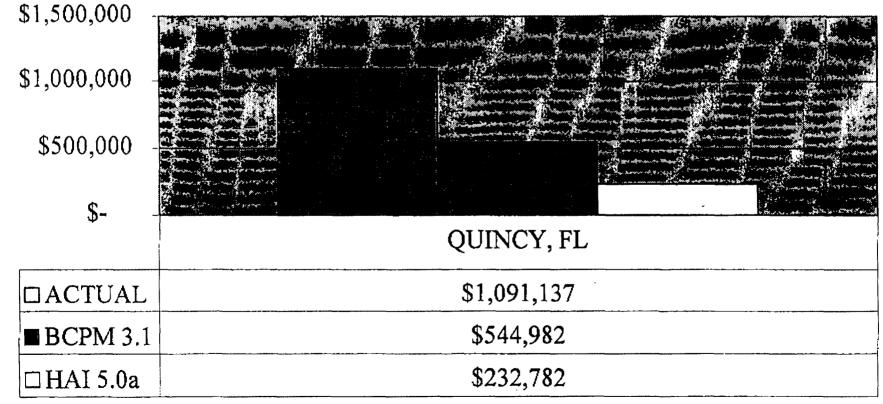

Actual support = USF + DEM + LTS

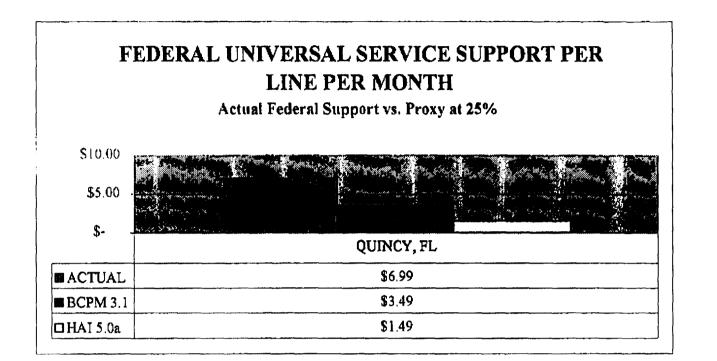

Proxy data represents wirecenter level calculation using model defaults.

Proxy support calculated on primary residential and single-line business lines.
